Radar Basics Radar Principle

The electronic principle on which radar operates is very similar to the principle of sound-wave reflection. If you shout in the direction of a sound-reflecting object (like a rocky canyon or cave), you will hear an echo. If you know the speed of sound in air, you can then estimate the distance and general direction of the object. The time required for an echo to return can be roughly converted to distance if the speed of sound is known.

SLAR (side-looking airborne radar) and did not use the principle of the synthetic aperture. This led to a moderate azimuth resolution which deteriorates as the range increases. For example, an X-band SLAR system with a 3-meter antenna has an azimuth antenna beamwidth of $\theta = 3 \cdot 003 \text{ m} / 001 \text{ m} = 3 \text{ rad}$, a $m \cdot H = (1)$ where m is the wavelength. The azimuth resolution θ is given by the

Radar Basics

Airborne Weather Radar It is common that the majority of commercial aircraft nowadays carry an Airborne Weather Radar system that is most often built into the aircraft nose. A maximum range of 180 Nm is common although the commonly used range (as selected by pilots) would normally be in the 30 to 80 Nm range.

Radar Basics Physical fundamentals of the radar principle

These principles can basically be implemented in a radar system, and allow the determination of the distance, the direction and the height of the reflecting object. (The effects atmosphere and weather have on the transmitted energy will be discussed later; however, for this discussion on determining range and direction, these effects will be temporarily ignored.)
